## Lecture 8 – CSS Techniques

# CSS Techniques

---

- Centring a Page
- Two Column Layouts
  - Floating
  - Absolute Positioning
- Three Column Layouts
  - Floating
  - Absolute Positioning
- Useful Websites

# Centreing a Page

---

## Method 1 – The Official CSS Way

```
<html>
  <head>
    <link rel="stylesheet" type="text/css" href="ExWD08A.css" />
  </head>
  <body>

    <div id="page">
      <h1>This is the heading</h1>
      This is the text. This is the text. This is the text. This is the text. This
      is the text. This is the text. This is the text. This is the text. ....
    </div>

  </body>
</html>
```

# with this stylesheet

---

```
div#page
{
width: 500px;
margin-left: auto;
margin-right: auto;
}
```

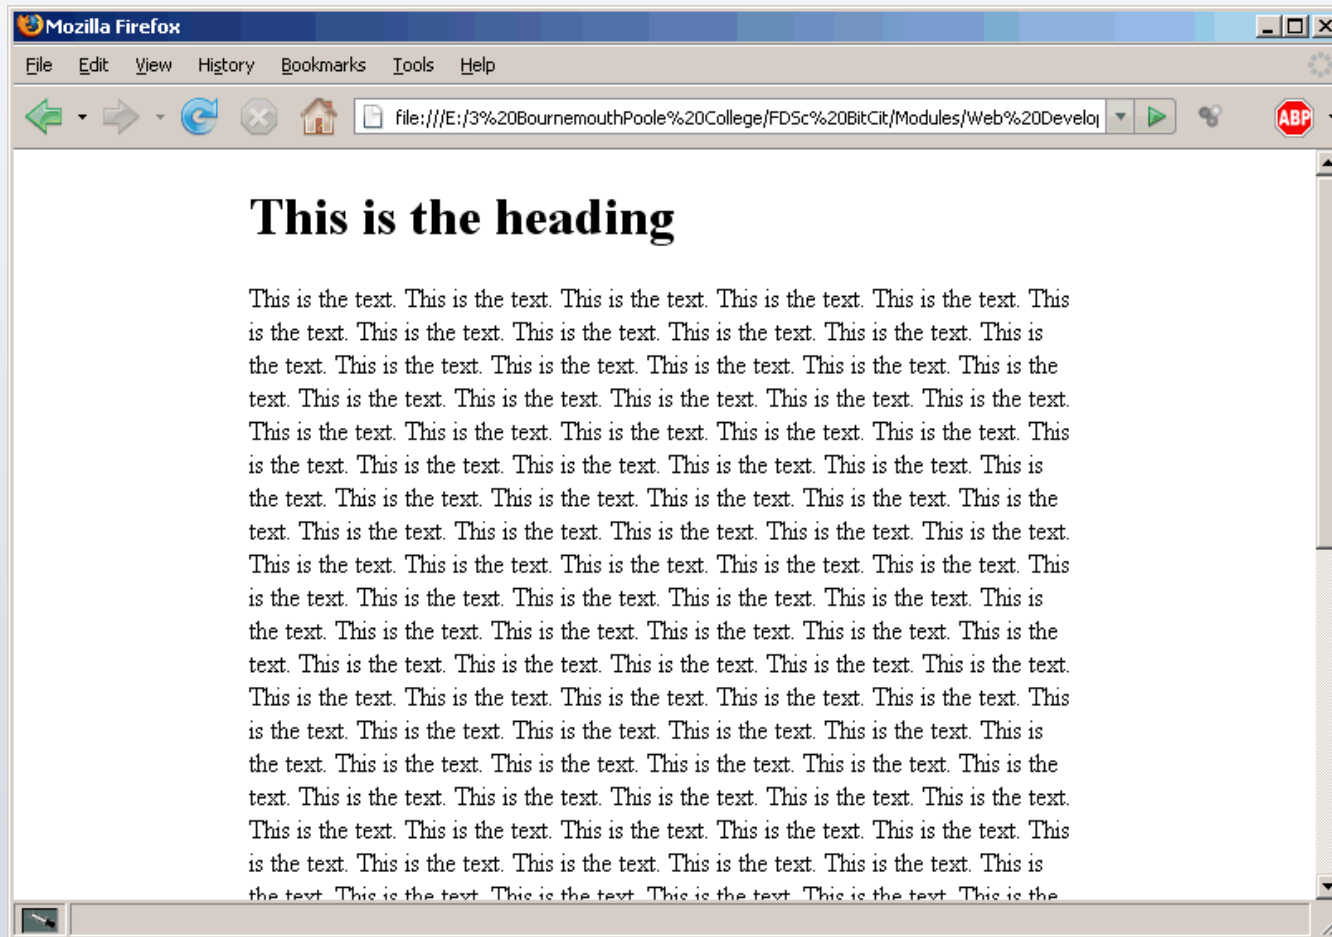

Specify a width for the element that contains the page's contents.

Set the margins to auto.

This will automatically centre the element in the containing block (in this case, the body element).

# will give this

---

If for some reason it doesn't work.....

# ... Use this method

---

Another way of doing the same thing is to use this trick.

```
div#page
{
position: absolute;
left: 50%;
width: 500px;
margin-left: -250px;
}
```

Using absolute positioning, place the left side of the block half way across the containing block (ie the browser window).

Then set a negative margin of half the width of the block.

This will place the block in the centre, no matter how much you resize the window.

# Two Column Layout Using Floats

---

I won't bother showing the `<html>` and `<body>` tags from now on...

```
<div class="masthead">  
<h1>This is the masthead</h1>  
</div>
```

The masthead will be at the top of the page because it comes first

```
<div class="main">  
<h1>This is the heading</h1>
```

This is the text. This is the text. This is the text. This is the text. This is the text.  
This is the text. This is the text. This is the text. This is the text.

```
</div>
```

```
<div class="sidebar">
```

```
Link 1<br /><br />
```

```
Link 2<br /><br />
```

```
Link 3<br /><br />
```

```
Link 4<br /><br />
```

```
</div>
```

```
<div class="footer">
```

```
Copyright Information
```

```
</div>
```

The main content is placed before the sidebar for the benefit of non-graphical browsers.  
Note the meaningful class names

# with this stylesheet

---

```
.masthead
{
background: #00FFFA;
padding: 15px;
}
```

```
.main
{
float: left;
width: 70%;
margin-right: 3%;
margin-left: 3%;
}
```

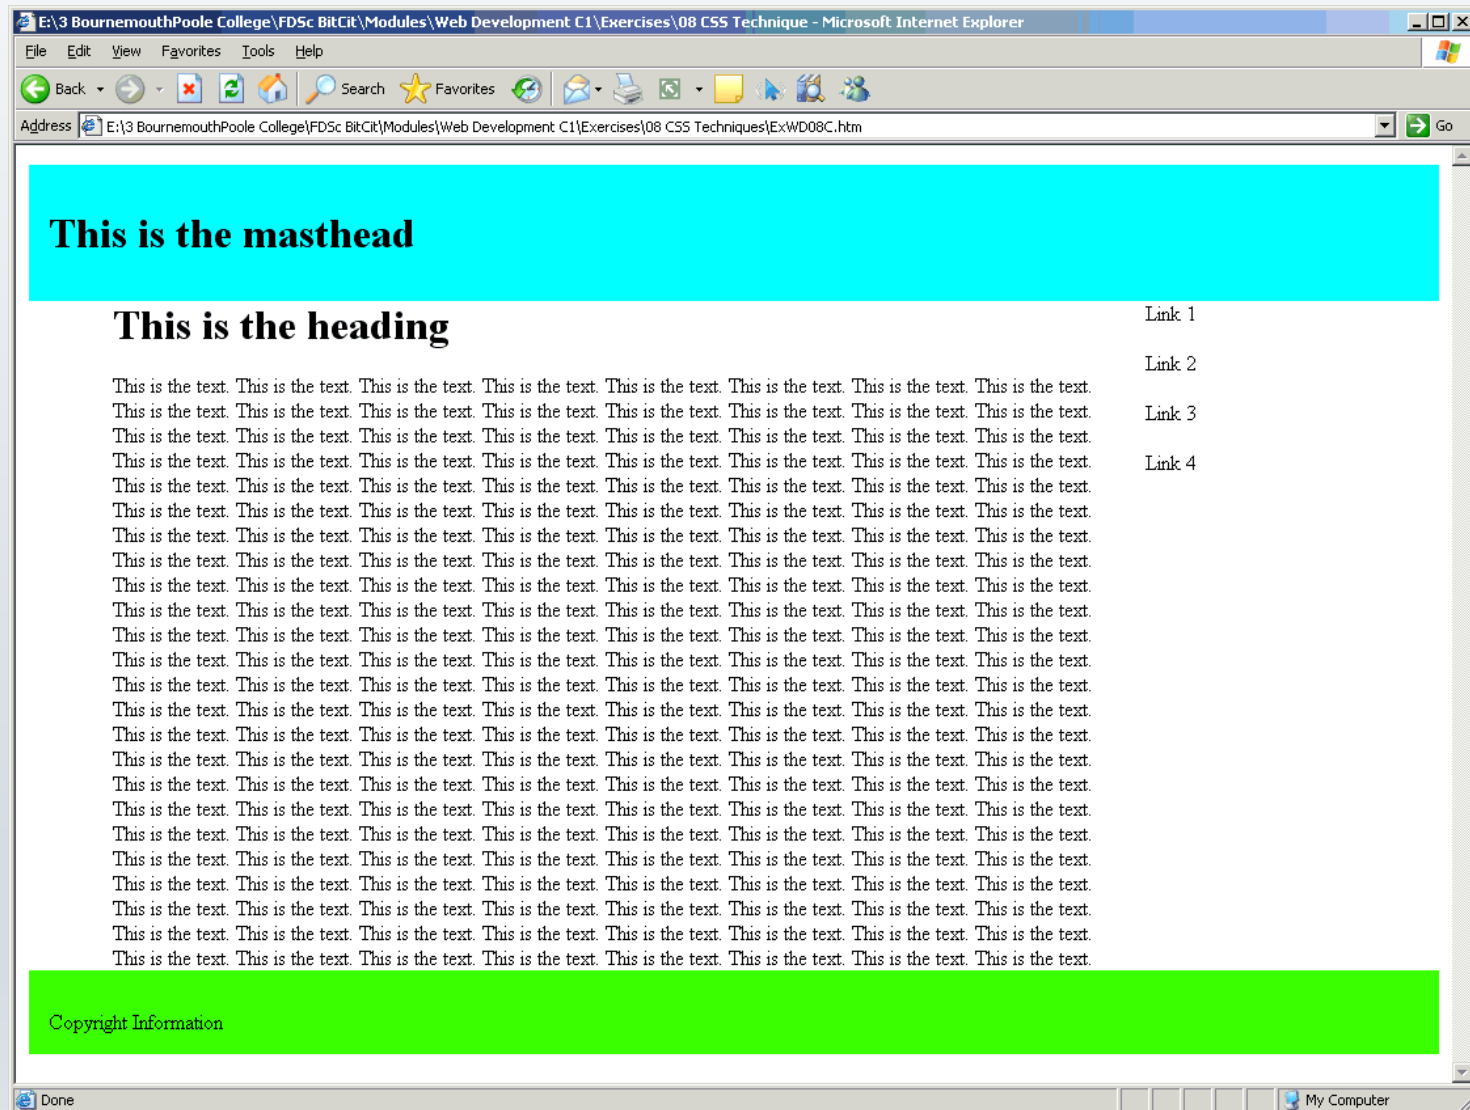

The main div is floated to the left, and set to 70% of page width.  
Sidebar will flow around it.

```
.footer
{
clear: left;
padding: 15px;
background: #3DFF00;
}
```

Clear property will ensure that the footer lies below any other element which has been floated to the left of the page.

# will give this

# Two Column Layout Using Absolute

---

Using the same <div> structure as before. Order of the div elements is not so critical as with absolute positioning, we can put them where we want:

```
body  
{  
margin: 0;  
padding: 0;  
}
```

Clears any default browser  
formats

```
.masthead  
{  
margin-right: 30%;  
margin-left: 5%;  
background: #00FFFA;  
}
```

Makes room for  
the positioned  
sidebar

# Two Column Layout Using Absolute

---

```
.main
{
margin-right: 30%;
margin-left: 5%;
}
```

Makes room for the positioned sidebar

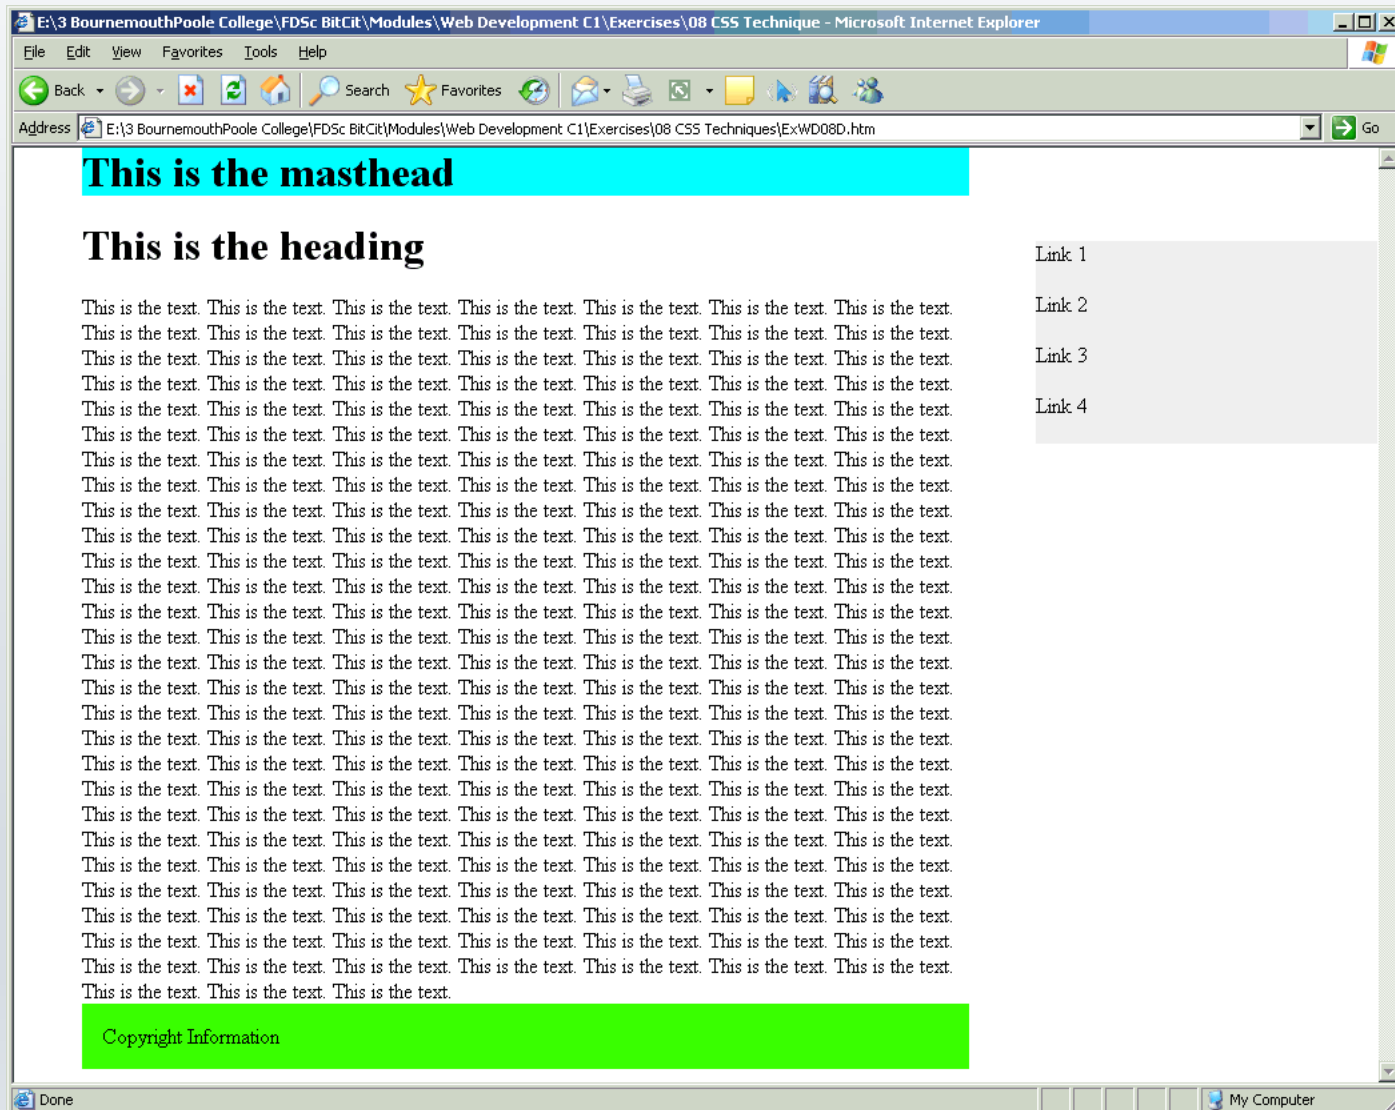

```
.sidebar
{
position: absolute;
top: 70px;
right: 0px;
width: 25%;
background: #EEEEEE
}
```

Places the sidebar below the masthead, and against the right edge of the window

```
.footer
{
padding: 15px;
background: #3DFF00;
margin-right: 30%;
margin-left: 5%;
}
```

Keeps the footer aligned with the main content

# will give this...

# with this stylesheet

---

```
#container
{
width: 705px;
border: solid 2px;
}
```

Note that the container has been given a width.

```
#masthead
{
padding: 15px;
background: #00FFFA;
}
```

```
#links
{
width: 150px;
float: left;
background: #FF7700;
}
```

This should place the links div on the left hand side of the page.

---

```
#main
{
float: left;
width: 400px;
}
```

The main content div will then float to the left of the page, bumping up against the links.

```
#news
{
float: left;
width: 150px;
background: #EEEEEE
}
```

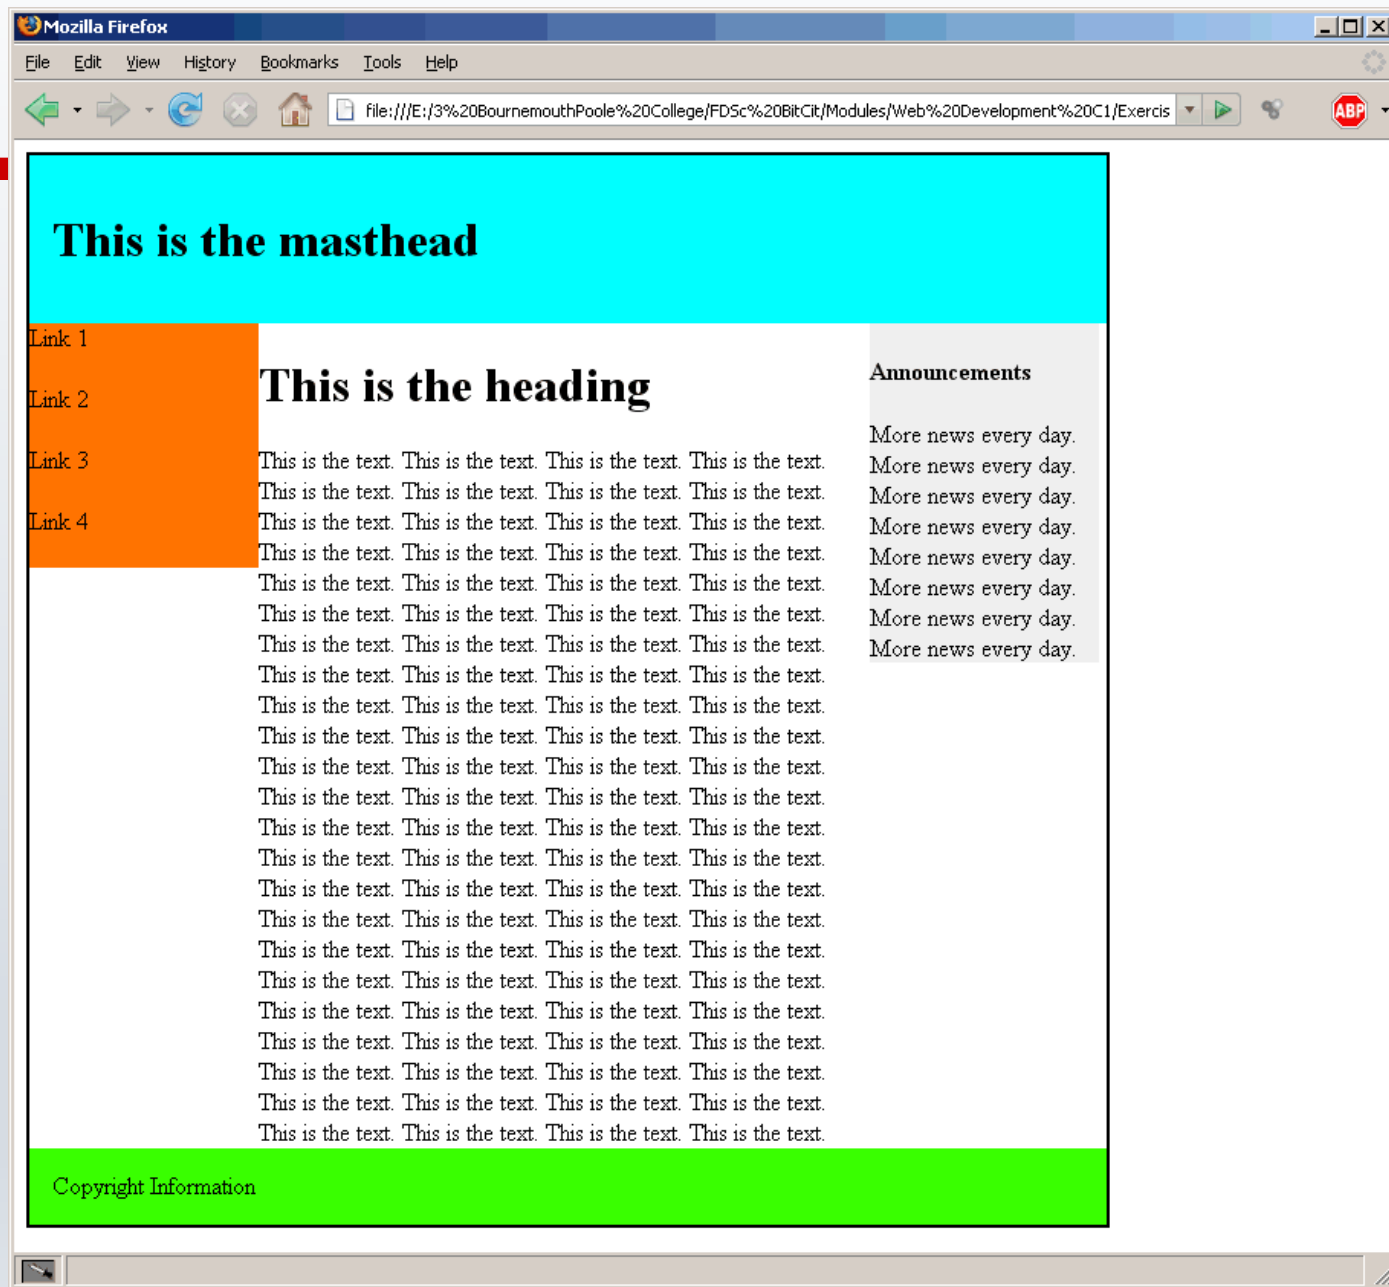

And then the news div, which will bump up against the main div.

What would happen if width was 300px?

```
#footer
{
clear: both;
padding: 15px;
background: #3DFF00;
}
```

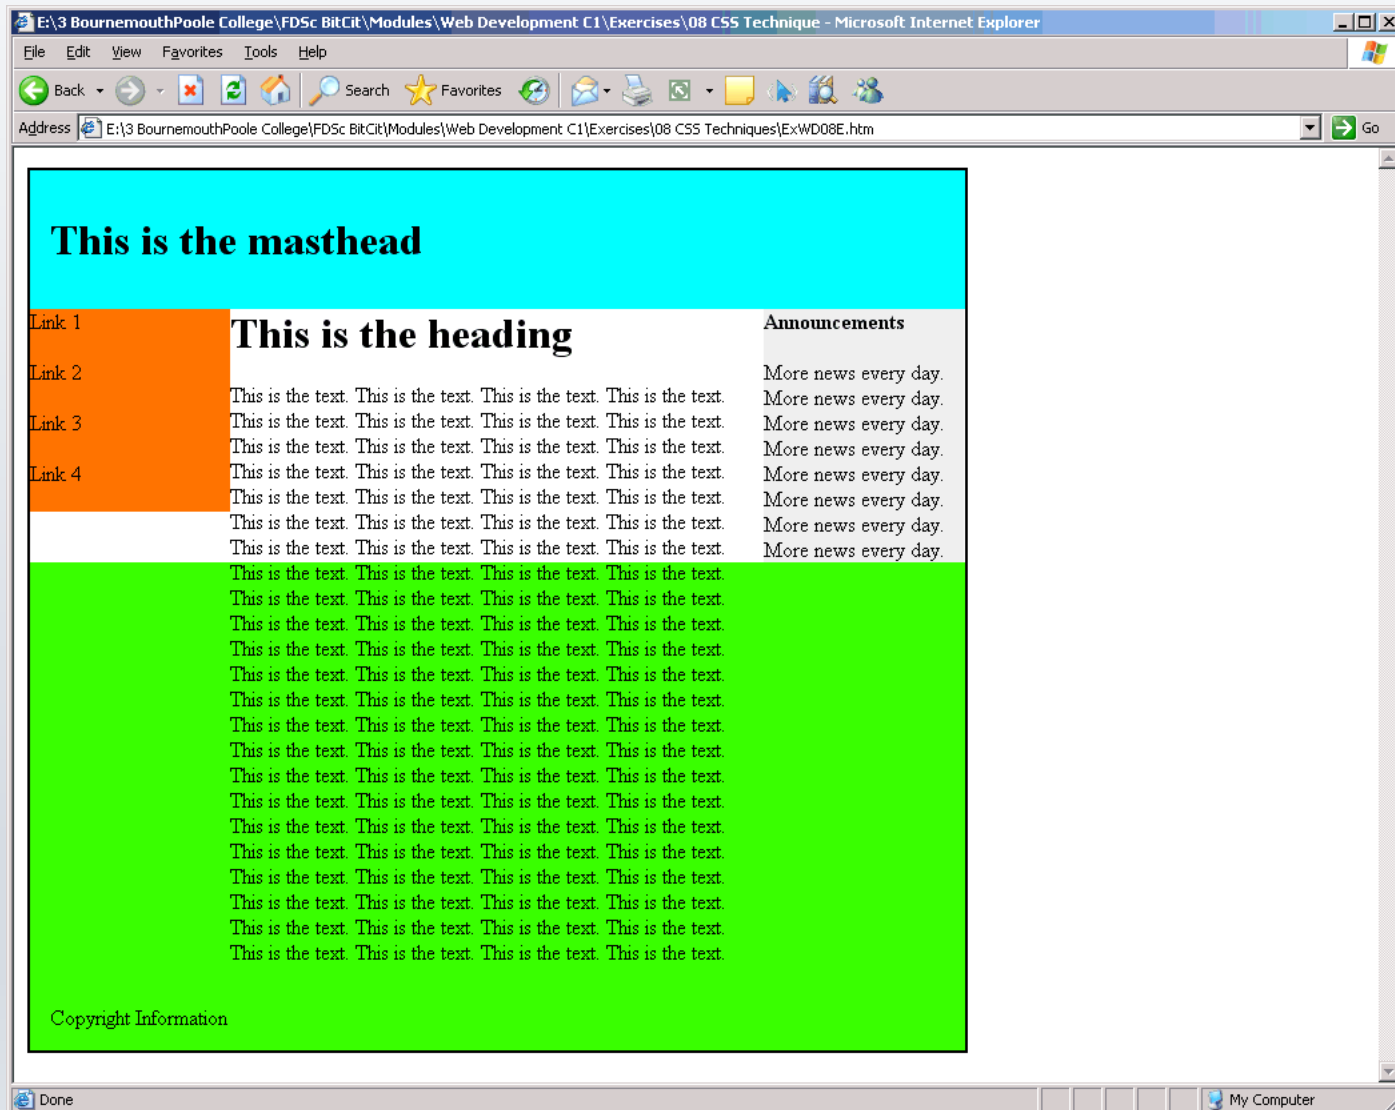

The clear property will ensure that the footer will not try to float up to the side of the other divs, but stay at the bottom.

# In Firefox

# and in old versions of Internet Explorer.

---

Some browsers adhere to the standards better than others.

All browsers have little quirks, which must be worked around.

See <http://www.quirksmode.org/css/contents.html>

The new version of Internet Explorer is much better at adhering to standards.

For an example of the sort of information this website contains, see:

<http://www.quirksmode.org/css/clearing.html>

# Three Column Layout using Absolute

---

```
<div id="container">
```

```
  <div id="masthead">
```

```
    <h1>This is the masthead</h1>
```

```
  </div>
```

```
  <div id="links">
```

```
    Link 1<br /><br />
```

```
    Link 2<br /><br />
```

```
  </div>
```

```
  <div id="main">
```

```
    <h1>This is the heading</h1>
```

```
    This is the text. This is the text.
```

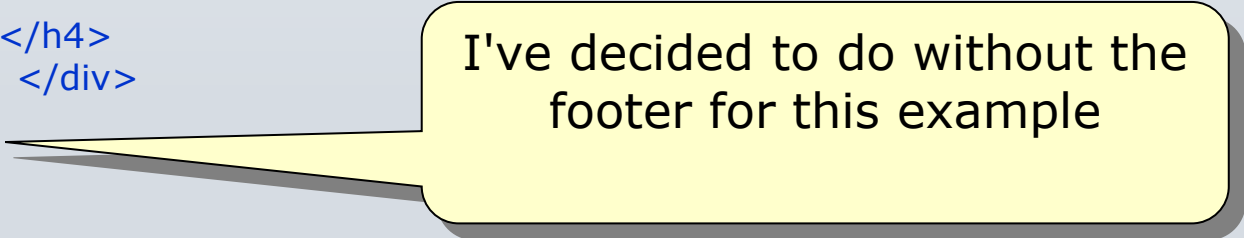

```
  </div>
```

```
  <div id="news">
```

```
    <h4>Announcements</h4>
```

```
    More news every day. </div>
```

```
</div>
```

I've decided to do without the footer for this example

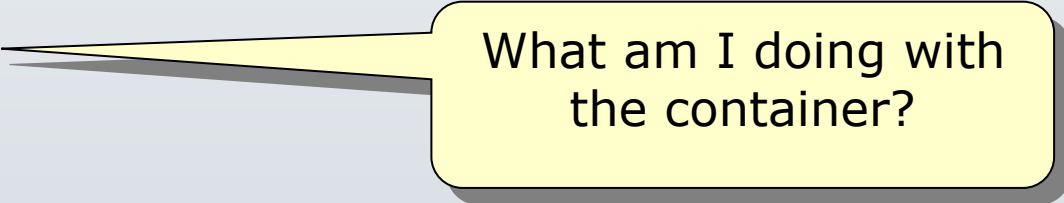

# with this stylesheet

---

```
body:  
{  
margin: 0;  
padding: 0;  
}
```

```
#container  
{  
position: relative;  
width: 700px;  
left: 50%;  
margin-left: -350px;  
}
```

```
#masthead  
{  
height: 70px;  
background: #00FFFA;  
}
```

What am I doing with  
the container?

```
#links
{
position: absolute;
top: 70px;
left: 0px;
width: 150px;
background: #FF7700;
}
```

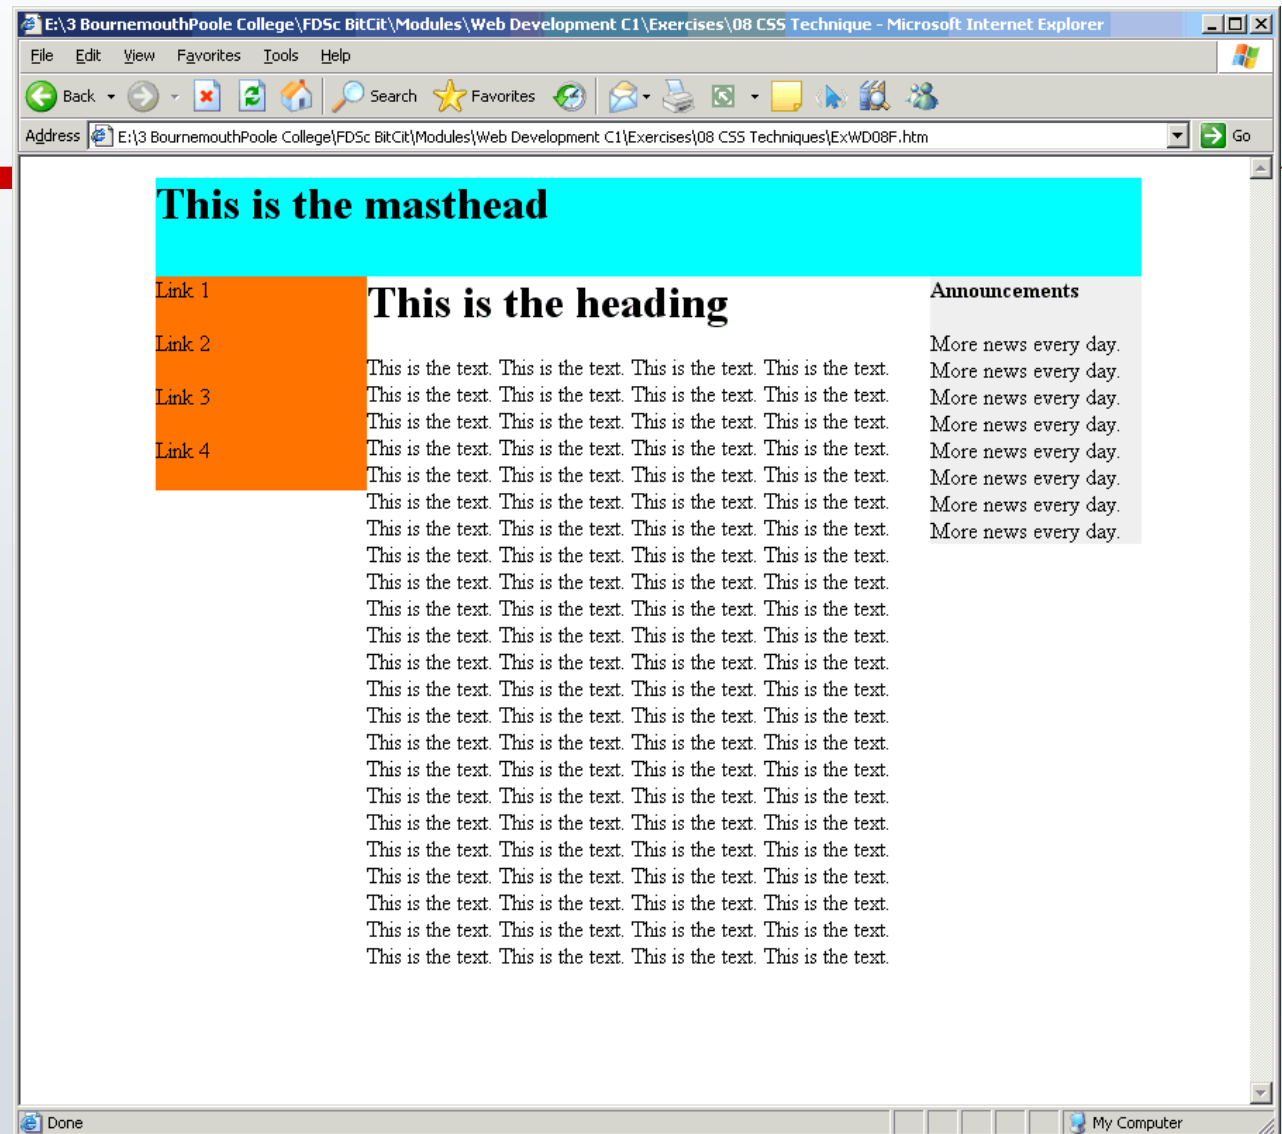

Position below the masthead.  
Up against the left side of the  
window.

```
#main
{
position: absolute;
top: 70px;
left: 150px;
width: 400px;
}
```

Leave room for the links  
sidebar

```
#news
{
position: absolute;
top: 70px;
left: 550px;
width: 150px;
background: #EEEEEE
}
```

Position below the masthead.  
Leave room for the links and the main  
content.
